Spring 2022 Data C100/C200 Midterm 1 Reference Sheet

Pandas

Suppose df is a DataFrame; s is a Series. pd is the Pandas package.

Function	Description		
df[col]	Returns the column labeled col from df as a Series.		
df[[col1, col2]]	Returns a DataFrame containing the columns labeled col1 and col2.		
<pre>s.loc[rows] / df.loc[rows, cols]</pre>	Returns a Series/DataFrame with rows (and columns) selected by their index values.		
<pre>s.iloc[rows] / df.iloc[rows, cols]</pre>	Returns a Series/DataFrame with rows (and columns) selected by their positions.		
<pre>s.isnull() / df.isnull()</pre>	Returns boolean Series/DataFrame identifying missing values		
<pre>s.fillna(value) / df.fillna(value)</pre>	Returns a Series/DataFrame where missing values are replaced by value		
<pre>df.drop(labels, axis)</pre>	Returns a DataFrame without the rows or columns named labels along axis (either 0 or 1)		
<pre>df.rename(index=None, columns=None)</pre>	Returns a DataFrame with renamed columns from a dictionary index and/or columns		
<pre>df.sort_values(by, ascending=True)</pre>	Returns a DataFrame where rows are sorted by the values in columns by		
s.sort_values(ascending=True)	Returns a sorted Series.		
s.unique()	Returns a NumPy array of the unique values		
s.value_counts()	Returns the number of times each unique value appears in a Series		
<pre>pd.merge(left, right, how='inner', on='a')</pre>	Returns a DataFrame joining DataFrames left and right on the column labeled a; the join is of type inner		
<pre>left.merge(right, left_on=col1, right_on=col2)</pre>	Returns a DataFrame joining DataFrames left and right on columns labeled col1 and col2.		
<pre>df.pivot_table(index, columns, values=None, aggfunc='mean')</pre>	Returns a DataFrame pivot table where columns are unique values from columns (column name colist), and rows are unique values from index (column name or list); cells are collected values using aggfunc. If values is not provided, cells are collected for each remaining column with multi-level column indexing.		
df.set_index(col)	Returns a DataFrame that uses the values in the column labeled col as the row index.		
df.reset_index()	Returns a DataFrame that has row index 0, 1, etc., and adds the current index as a column.		

Let grouped = df.groupby(by) where by can be a column label or a list of labels.

Function	Description		
grouped.count()	Return a Series containing the size of each group, excluding missing values		
<pre>grouped.size()</pre>	Return a Series containing size of each group, including missing values		
<pre>grouped.mean()/grouped.min()/grouped.</pre>	max() Return a Series/DataFrame containing mean/min/max of each group for each column, excluding missing values		
<pre>grouped.filter(f) grouped.agg(f)</pre>	Filters or aggregates using the given function f		
Function [Description		
s.str.len()	Returns a Series containing length of each string		
s.str.lower()/s.str.upper() F	Returns a Series containing lowercase/uppercase version of each string		
s.str.replace(pat, repl) F	Returns a Series after replacing occurences of substrings matching regular expression pat with string repl		

Returns a Series of the first subsequence of each string that matches the regular expression pat. If pat s.str.extract(pat) contains one group, then only the substring matching the group is extracted Tukey-Mosteller Bulge Diagram.

Returns a boolean Series indicating whether a substring matching the regular expression pat is contained

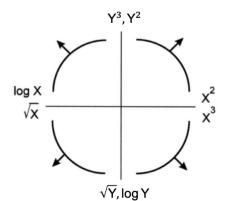

Visualization

s.str.contains(pat)

Matplotlib: x and y are sequences of values.

Function	Description
plt.plot(x, y)	Creates a line plot of x against y
<pre>plt.scatter(x, y)</pre>	Creates a scatter plot of x against y
<pre>plt.hist(x, bins=None)</pre>	Creates a histogram of x; bins can be an integer or a sequence
<pre>plt.bar(x, height)</pre>	Creates a bar plot of categories x and corresponding heights height

in each string

Seaborn: x and y are column names in a DataFrame data.

Function	Description Create a barplot of value counts of variable x from data		
<pre>sns.countplot(data, x)</pre>			
<pre>sns.histplot(data, x, kde=False) sns.displot(x, data, rug = True, kde = True)</pre>	Creates a histogram of x from data; optionally overlay a kernel density estimator. displot is similar but can optionally overlay a rug plot.		
<pre>sns.boxplot(data, x=None, y) sns.violinplot(data, x=None, y)</pre>	Create a boxplot of y, optionally factoring by categorical x, from data. violinplot is similar but also draws a kernel density estimator of y.		
<pre>sns.scatterplot(data, x, y)</pre>	Create a scatterplot of x versus y from data		
<pre>sns.lmplot(x, y, data, fit_reg=True)</pre>	Create a scatterplot of $\mathbf x$ versus $\mathbf y$ from $\mathbf data$, and $\mathbf b\mathbf y$ default overlay a least-squares regression line		
<pre>sns.jointplot(x, y, data, kind)</pre>	Combine a bivariate scatterplot of x versus y from data, with univariate density plots of each variable overlaid on the axes; kind determines the visualization type for the distribution plot, can be scatter, kde or hist		

Regular Expressions

List of all metacharacters: . ^ $$* + ?] [\ \] () { }$

Operator	or Description		Operator Description		
	Matches any charact	er except \n	*	Matches preceding character/group zero or more times	
\\	Escapes metacharacters		?	Matches preceding character/group zero or one times	
I	Matches expression on either side of expression; has lowest priority of any operator		+	Matches preceding character/group one or more times	
\d, \w, \s	Predefined character group of digits (0-9), alphanumerics (a-z, A-Z, 0-9, and underscore), or whitespace, respectively		^, \$	Matches the beginning and end of the line, respectively	
\D, \W, \S	Inverse sets of \d, \w, \s, respectively		()	Capturing group used to create a sub-expression	
{m}	Matches preceding character/group exactly m times		[]	Character class used to match any of the specified characters or range (e.g. [abcde] is equivalent to [a-e])	
{m, n}	Matches preceding character/group at least m times and at most n times if either m or n are omitted, set lower/upper bounds to 0 and ∞ , respectively		[^]	Invert character class; e.g. [^a-c] matches all characters except a, b, c	
Function	Function Description				
re.match(pattern, string) Returns a match if zero or		more characte	ers at beginning of string matches pattern, else None		
re.search(pattern, string) Returns a match if zero or r		more characters anywhere in string matches pattern, else None			
re.findal	re.findall(pattern, string) Returns a list of all non-overlapping matches of pattern in string (if none, returns empty list)				
re.sub(pa	re.sub(pattern, repl, string) Returns string after replacing all occurrences of pattern with repl				

Modified lecture example for a single capturing group:

```
lines = '169.237.46.168 - - [26/Jan/2014:10:47:58 -0800] "GET ... HTTP/1.1"'
re.findall(r'\[\d+\/(\w+)\/\d+:\d+:\d+ .+\]', line) # returns ['Jan']
```

Modeling

Concept	Formula	Concept	Formula
$L_1 \mathrm{loss}$	$L_1(y,\hat{y}) = \mid y - \hat{y} \mid$	$ Correlation \ r $	$r = rac{1}{n} \sum_{i=1}^n rac{x_i - ar{x}}{\sigma_x} rac{y_i - ar{y}}{\sigma_y}$
$L_2 \mathrm{loss}$	$L_2(y,\hat{y}) = (y-\hat{y})^2$	Linear regression prediction of y	$\hat{y} = a + bx$
Empirical risk with loss L	$R(heta) = rac{1}{n} \sum_{i=1}^n L(y_i, \hat{y_i})$	Least squares linear regression, slope \hat{b}	$\hat{b} = r \frac{\sigma_y}{\sigma_x}$
